Increase shop floor productivity

Assessing your current situation can identify areas affecting productivity

Invest in up to date machinery and innovations to help do the job

Does current machinery meet the business needs? Is machinery well maintained or are there new technologies that would be more efficient?

Look after your workforce

When workers are aligned with the goals of the business, productivity increases. Is training and career advancement available? Are they included in procedure decisions? Are working conditions respectable?

Is the process at its most efficient?

Would a change in layout aid improvement? Are certain areas lacking in resources? Are workers adequately trained in latest techniques? Are workspaces optimised for efficiency?

Reduce production bottle necks

Is an area producing more inventory than can be moved through the process? Bring workflow into line using new technologies and processes.
